

Chhattisgarh State Artificial Intelligence Mission (CG-AIM) – Strategy for AI Deployment

July 2026

Comparison of AI Deployment Options

Comparison of different approaches for sustainable AI deployments

1

Enterprise AI Platform

2

Forest AI Stack

3

State Data Exchange Platform (Telangana TGDeX-style)

4

Government Officer Productivity Platform (Enterprise Copilot)

5

Use Cases specific Agentic AI Platform

6

Agentic AI Marketplace (CHiPS does empanelment for Agentic AI transformation)

7

Department-Specific AI (SI implementing AI use cases from different departments)

8

Chhattisgarh's AIKosh

9

State Small Language Model

10

State AI Stack (the full reusable enterprise architecture)

Enterprise AI Platform

A centralized AI platform that provides reusable AI infrastructure, foundation models, and shared AI services for all government departments.

Features

- LLM orchestration and multi-LLM access
- API Gateway for AI services
- GPU-as-a-Service (subject to discussion)
- Enterprise vector database
- Prompt management and reusable prompt library
- Model registry and lifecycle management
- Role based access
- Usage analytics and cost monitoring
- Responsible AI guardrails and audit logging
- SDKs and low-code/No-code development

Approach for Implementation

- Consultation with the departments to obtain priority use cases to be implemented through platform and assess AI readiness
- Industry consultation for comparing architecture components-cost for the same - Consultation with Players like IBM, Salesforce, AWS, Google, Microsoft, Teradata, Oracle, Sarvam, BharatGen etc.
- Prepare proposal along with architecture diagram such that it has feasible components and minimum vendor lock-in capabilities
- Prepare RFP and perform bid process management
- Vendor onboarding
- Training of departments on the platform and support to vendor for implementation

Advantages

- Creates a common AI foundation that can be reused across all departments, reducing duplication.
- Consistent governance, security and audit.
- Removes duplicate GPU procurement
- Accelerates deployment of new AI applications using reusable platform services.
- Simplifies monitoring of AI usage, performance, and costs across departments.

Challenges

- Success of Platform investment depends upon Departments adoption/utilization of platform services which requires extensive training, support and monitoring.
- Needs a dedicated platform engineering and MLOps team for ongoing operations.
- Needs multi-tenant cost allocation model
- Technology upgrades will be required as AI models and tools evolve.

Key Decision Points

Is the SI expected to provide the Platform and implement the AI use cases or just implement the Platform and AI use cases to be implemented by the departments?

Is it expected that the SI to provide GPU as a Service as part of the proposal itself?

What is the budget kept for this in case this approach needs to be adopted? What is the implementation timeline provided for this? Can closed source LLMs be supported or only Open Source/Open-Weight LLMs?

Is there a requirement that entire technology stack be Open Source? Is there an expectation that Vision LLMs be also made available as part of Platform?

Recommendation: May be implemented subject to adequate need establishment and support from the departments with respect to the priority use cases to be implemented

Forest AI Stack

A dedicated AI stack purpose-built for the Forest Department, leveraging forest datasets (subject to availability) geospatial, satellite, drone, and field data to improve forest governance and conservation.

Features

- Satellite/remote-sensing based forest cover change detection
- AI-based forest fire prediction and early warning
- Wildlife movement and human-animal conflict prediction
- Illegal logging and encroachment detection via drone/satellite imagery
- Biodiversity and carbon-stock estimation models
- Field mobile app with offline AI inference for frontline staff
- GIS integration with compartment-level forest working plans
- Dashboard for monitoring and alerts

Approach for Implementation

- Consultation with Forest Department to prioritize use cases (fire, encroachment, conflict)
- Assess data sources - ISRO Bhuvan, Survey of India etc.
- Consultation with donor agencies working in DPIs for funding/engagement of the project – Gates Foundation/EkStep foundation/World Bank etc.
- Request support from donor agencies to support pilot in 2-3 divisions on OpenNetwork before state-wide rollout
- Prepare SOP for mobilization of ecosystem players involved in Forest AI Stack
- Prepare RFP for SI for state-wide rollout of Forest AI Stack

Advantages

- Potential of procuring funding from donor agencies if positioned as a DPI. First of its kind implementation in the country
- Purpose-built for forest domain data
- Enables early detection of forest fires, encroachments, and illegal activities.
- High visibility, high impact use case that showcases state AI capability
- Builds reusable geospatial-AI competency extendable to other relevant use cases

Challenges

- Ground-truthing and field data collection needed for compartment-level accuracy
- Connectivity gaps in forest/remote areas may limit real-time field usage
- May need high-resolution satellite/drone imagery, which can be costly and license-dependent
- Requires specialized geospatial-AI skills

Key Decision Points

Is there any budget already allocated for Forest AI Stack implementation?

Would it be okay to position Chhattisgarh Forest AI Stack as DPI so that discussions with donor agencies can be done?

What is the status of availability of high-resolution satellite/drone imagery for Forest AI use cases? Will ISRO/national agencies (FSI, NRSC) be partners, or will stack components be fully vendor-built?

Recommendation: Pilot in 2-3 divisions on OpenNetwork before state-wide rollout

State Data Exchange Platform

A secure, state-wide data exchange layer enabling consented, API-based data sharing across departments, modelled on Telangana's TGDeX with pillars as Data Banks, AI Models, Use Cases, and Sandbox IDE.

Features

- Consent-based data exchange APIs across department databases
- Data schema/registry and metadata catalogue
- API gateway with authentication, rate-limiting and audit trail
- Data quality and de-duplication services
- Integration with Aadhaar/DigiLocker/state SSO for identity verification
- Real-time and batch data exchange modes
- Dashboards for data-sharing requests and approvals
- Grievance and consent-withdrawal management

Approach for Implementation

- Study the TGDeX reference architecture
- Identify 4-5 high value data sources (land records, ration card, caste certificate, etc.) for initial roll out
- Draft data-sharing policy, consent framework, and inter-department MoUs
- Prepare RFP to build/procure the exchange platform - API gateway, catalogue, consent manager
- Onboard departments in phases with dedicated change-management support

Advantages

- Removes the need for departments to build one-off point-to-point integrations
- Improves data quality and reduces citizen re-submission of documents
- To provide ease in implementation of cross-sector AI use cases
- If built as a DPI on lines of TGDeX, would enable involvement of larger AI ecosystem players in AI implementation

Challenges

- Needs a strong legal/consent framework and data-sharing MoUs across departments
- Significant change management - departments must open up siloed databases
- Data quality issues in legacy departmental systems need fixing before exchange
- Long gestation period before visible citizen-facing benefit

Key Decision Points

Should CHiPS build this in-house, adopt completely open-source stack or engage an SI?

Is there any existing Data Lake or Lakehouse that can be leveraged as foundation for Enterprise AI Platform?

What would be Chhattisgarh department's AI readiness to share the datasets?

Recommendation: Successful implementation of this project will require mandate and rigorous monitoring at Chief Minister's or Chief Secretary's level to ensure getting datasets and subsequently adequate repository of AI use cases. It has long period before witnessing large scale AI impact. Hence, not recommended at initial stage wherein priority is for quick wins for large scale AI deployment and impact.

Government Officer Productivity Solution

An internal AI copilot for government officers - drafting notes, summarising files, searching circulars/GRs, and automating routine office work.

Features

- NLP based search over circulars, government orders etc.
- File-noting and draft-reply generation assistant
- Multilingual support (Hindi/English)
- Integration with e-Office and department document repositories
- Voice-to-text for note dictation
- Role-based access aligned to department hierarchy
- Usage analytics for adoption tracking

Approach for Implementation

- Assess document repository integration feasibility and data residency requirements
- Industry consultation to get estimate on budget
- Prepare proposal, RFP and bid management for vendor onboarding

Advantages

- High employee-facing impact and quick, demonstrable productivity gains
- Lower technical complexity than a full enterprise AI platform - faster time to value
- Quick win for large scale AI Implementation – Andhra Government has done this using Gemini models for some of these features

Challenges

- Needs required document, integration with e-Office/legacy document systems
- Requires guardrails so AI-drafted notes/orders are reviewed
- Data privacy for sensitive government files to be managed
- Adoption depends on engagement of different departments in sharing these documents

Key Decision Points

Should this run on closed-source (cloud) LLMs or open-weight model for data sovereignty?

Which of the mentioned features can be dropped as that will impact the price estimate also?

How would it be ensured that Departments participate actively in fetching the required documents?

How will this copilot relate to and reuse components from a future Enterprise AI Platform?

Recommendation: Not recommended as the architecture components would not be reusable for other large scale AI implementation

Agentic AI Solutions Implementation

A platform focused on autonomous multi-agent workflows for specific high-value use cases such as audit, compliance checks, and multi-step administrative workflows.

Features

- Multi-agent orchestration framework (planner, executor, verifier agents)
- Workflow/process automation connectors to departmental systems
- Automated audit-trail generation and compliance checking
- Human-in-the-loop approval checkpoints
- Agent monitoring, replay and rollback tools
- Exception handling and escalation to human officers
- Reusable agent templates for common government workflows
- Integration with document/records management systems

Approach for Implementation

- Identify 3-4 clear, rules-based, high-volume workflows (e.g. internal audit, scheme verification) for pilot
- Map the current manual workflow
- Prepare proposal, RFP and perform bid process management for vendor onboarding
- Design audit-trail and rollback mechanisms
- Run a parallel-run (agent + manual) validation phase before full automation
- Document learnings to inform the state's broader agentic AI strategy

Advantages

- Targets high-value, well-defined workflows (audit, compliance) with clear ROI
- Can significantly reduce manual effort in repetitive multi-step verification tasks
- Narrower scope than a full platform, making it faster and cheaper to prove value
- Success stories are highly demonstrable to leadership and other departments

Challenges

- Deep integration with each department's specific systems/workflows needed - not plug and play
- Need for well-defined guardrails

Key Decision Points

Which Agentic AI use cases to be selected which also has AI readiness?

Should this be run as empanelment by CHiPS or as a separate RFP?

Recommendation: Recommended as a focused, well-governed pilot on 3-4 use cases rather than a broad platform investment at this stage, given the early maturity of AI in Chhattisgarh

Empanelment for Agentic AI

Rather than building or operating AI itself, CHiPS empanels Agentic AI solution providers for modernization of Agentic AI workflows

Approach

- Define empanelment criteria - technical, pricing, and past performance etc.
- Publish an EOI/RFP for Agentic AI vendor empanelment across defined use-case categories
- Evaluate and empanel qualified vendors; publish a rate contract/framework
- Issue guidelines to departments for engaging empanelled vendors, with a baseline security/RAI checklist
- Set up a light-touch central oversight cell within CHiPS empanelment team to track issues (if any)
- Review performance annually and refresh the empanelment as required

Advantages

- Fastest path to enabling department-level AI adoption - no central platform build needed
- Leverages competitive market pricing and innovation from multiple vendors
- Departments retain flexibility to choose solutions matched to their specific needs
- Lower upfront capital and technical burden on CHiPS
- Scales naturally as more departments and use cases come forward

Challenges

- Risk of fragmented, inconsistent AI adoption without shared governance or data standards
- No central reusable infrastructure - duplicate spend likely across departments
- Harder to enforce Responsible AI, security, and audit consistency across many vendors

Key Decision Points

Should EOI/RFP define the high ROI impactful Agentic AI use cases?

Do we know budget allocation by Departments for Gen AI/Agentic AI use cases?

Should this run in parallel with, rather than instead of, a future Enterprise AI Platform?

Recommendation: Would provide CHiPS with adequate provisions to govern AI implementation

Department-Specific AI

SI is onboarded to implement select AI use cases as CHiPS would finalize basis consultation with the Departments

Approach for Implementation

- Identification, definition and prioritization of AI use cases across the departments
- Obtain volumetrics and data availability for the prioritized AI use cases
- Prepare proposal, RFP and perform bid process management to onboard the SI

Advantages

- Specified number of AI use cases implementation would be the scope of the SI

Challenges

- Departments need to provide commitment with respect to datasets provision and technical support as per the timelines that would be mentioned in the potential procurement pathway

Key Decision Points

What can be the priority departments from where to get the AI use cases

Would GPUs be procured from IndiaAI or would SI need to have a back-to-back agreement with Infrastructure service provider

Recommendation: Not recommended as the primary state strategy - while flexible for a single motivated department, it forgoes economies of scale and creates long-term governance and cost risks; suited only as a fallback for isolated, department-specific needs.

AIKosh-Style AI Experimentation Platform

A state-level experimentation and dataset-sharing platform modelled on the national AIKosh initiative, giving departments, startups and researchers a sandbox with curated datasets and models.

Features

- Curated state datasets (anonymised/aggregated) published for AI experimentation
- Model repository/registry of open and fine-tuned models
- Sandbox environment for departments, startups and academia to prototype
- Dataset quality, licensing and anonymisation tooling
- Community contribution and feedback mechanism
- Innovation challenges/hackathons hosted on the platform
- Usage tracking and citation of datasets/models used in solutions

Approach for Implementation

- Study the national AIKosh platform architecture and data-sharing framework for reuse
- Set up sandbox infrastructure and a dataset/model registry
- Run an initial hackathon/innovation challenge to seed use cases and engagement
- Establish a data governance/privacy review process for ongoing dataset additions
- Periodically showcase successful prototypes for possible graduation into production platforms

Advantages

- Encourages an innovation ecosystem - startups, students, researchers can build on state data

Challenges

- Does not directly deliver production AI services to departments or citizens. Success is harder to measure in the short term compared to a production platform
- Duplication of efforts when national level asset is already developed - AIKosh
- Value depends on active ecosystem participation (startups, researchers), which takes time to build
- Needs ongoing curation effort to keep datasets and models relevant and high quality

Key Decision Points

What would be Chhattisgarh Govt departments speed and willingness to share the datasets?

Should this be run solely by CHIPS or in partnership with academic institutions/startup cells?

How will successful experiments be transitioned into funded, production-grade solutions?

Recommendation: Not recommended to implement the same platform as National level asset AIKosh is already developed. However, it is recommended that Hackathons be floated on AIKosh Platform requesting MeitY for giving award money and mentorship support for the same.

State Small Language Model (SLM)

Development of a state-owned small language model trained on Chhattisgarh-specific administrative, legal and local-language data for government use.

Features

- SLM on Chhattisgarhi/Hindi administrative and legal corpus
- State controlled compute services
- Lower per-query cost than large closed-source LLM APIs at scale
- Availability of the APIs for the AI use cases
- Continuous fine-tuning pipeline as new government data becomes available

Approach for Implementation

- Assess feasibility - available Chhattisgarhi/Hindi corpora, compute budget, and talent availability
- Start from an existing open-weight base model (e.g. an Indic LLM) rather than training from scratch
- Curate and clean a government administrative/legal text corpus for fine-tuning
- Fine-tune and evaluate against benchmark tasks - government Q&A, drafting, summarisation
- Pilot as the backend for one use case (e.g. officer copilot) before wider adoption

Advantages

- Tailored accuracy for local language (Chhattisgarhi) and state-specific administrative content

Challenges

- Significant upfront investment in compute (GPUs), data curation
- Requires continuous MLOps effort to retrain/fine-tune as data and requirements evolve
- Extensive involvement of the ecosystem required from data annotators, data validators, academic partners and partners like Bhashini

Key Decision Points

Has there any discussion that has happened with Bhashini on this subject?

Should the state partner with an academic/research institution or national initiative (e.g. BharatGen)?

Would compute be obtained from IndiaAI Mission, or accessed via GPU-as-a-Service from a vendor?

Recommendation: Recommended in partnership with an existing Indic-LLM initiative like Bhashini rather than built from scratch. Since time to production grade APIs will take time, hence, discussions can initiate on these lines.

State AI Stack

A full, reusable state AI enterprise architecture combining platform infrastructure, data exchange, agentic workflows requiring ecosystem support for its success

Features

- Unified LLM orchestration layer supporting commercial, open-source and state SLM models
- Integrated state data exchange and consent layer
- Shared GPU-as-a-Service and compute infrastructure
- Common Responsible AI, security and audit framework across all use cases
- Reusable component library - copilot, chatbot, agentic workflow templates
- Central AI usage, cost and performance monitoring across all departments
- Departmental self-service onboarding once foundational layers are in place
- Long-term roadmap covering copilot, agentic, and SLM capabilities on one architecture

Approach for Implementation

- Conduct a comprehensive state-wide AI readiness and use-case prioritisation study across departments
- Prepare a multi-year roadmap and budget with clear phase-gates and success criteria
- Run industry consultation (IBM, AWS, Google, Microsoft, Sarvam, BharatGen etc.) for architecture and cost benchmarking
- Establish a dedicated central AI platform team, led by CHiPS, for ongoing operations and governance

Advantages

- Positions Chhattisgarh as a long-term leader in state-level AI infrastructure
- Every department benefits from shared investment, not just a few pilot departments

Challenges

- Long implementation timeline - full value realised only after multiple phases are complete
- Requires sustained leadership commitment and cross-department coordination over years
- Needs a large, skilled central team - platform engineering, MLOps, data governance, security
- Risk of over-engineering if department adoption/use cases do not materialise as planned

Key Decision Points

What is the acceptable implementation timeline before departments start seeing tangible value?

Should this be built by a single large SI, or phased across multiple specialised vendors per layer?

How will interim department needs be met while the full stack is being built out over multiple years?

Recommendation: This is a long-term end-state architecture, but given its scale and risk, domain specific Stack like Forest AI Stack is more effective in terms of implementation feasibility and speed to implementation. Hence, not recommended.

Recommended Approach for Chhattisgarh AI Deployment

Phase 1 - Quick Wins (3-4 months)

- **Agentic AI Solutions Implementation** - Recommended as a focused, well-governed solutions on 3-4 use cases rather than a broad platform investment at this stage. This will give quick wins at population scale in AI.
- **Forest AI Stack Development** – Tap in the donor agencies to support funding for Forest AI Stack Development as DPI. Pilot in 2-3 divisions on Open Network before state-wide rollout.
- **Run Hackathons on AIKosh** – Leverage AIKosh platform to run Chhattisgarh hackathons funded by GoI.

Phase 2 - Build foundation (4-8 months)

- **Empanelment for Agentic AI**- Publish an EOI/RFP for Agentic AI vendor empanelment. Evaluate and empanel qualified vendors. Publish a rate contract/framework for the same. Issue guidelines to departments for engaging empaneled vendors, with a baseline security checklist.
- **State Small Language Models**– Initiate partnership with an existing Indic-LLM initiatives like Bhashini. Also, partnership with academic institutions will help.

Phase 3 – Long term plan

- **Enterprise AI Platform** - After quick wins in terms of large-scale AI deployments in Chhattisgarh, consolidation of AI components at CHiPS level is encouraged through implementation of AI Platform such that it gives Chhattisgarh departments advantage of availability of AI components in a centralized manner.

Global Examples - Reusable AI Build

Global Cases Studies on AI Platform

Government	Description	Technology Stack
Singapore	Whole-of-government GenAI assistant for public officers built on a centralized AI platform. Shared AI infrastructure available across ministries and agencies. Provides secure GPU infrastructure, model access and AI development environment.	Government Commercial Cloud (GCC 2.0), Google Cloud Vertex AI, NVIDIA A100 GPUs, Gemini models, open-source models
Estonia	National AI ecosystem built on Estonia's X-Road digital infrastructure. Citizens interact through one virtual assistant while agencies reuse common AI services and data exchange components.	Open Source technologies build on X-Road stack
United Kingdom	Central AI incubator within government develops reusable GenAI tools that departments can adopt instead of building independently.	Microsoft Azure, Open Source technologies, secure government cloud, reusable APIs
United States	Federal shared AI acquisition, evaluation, governance and reusable AI services. GSA provides government-wide procurement vehicles and common guidance.	FedRAMP cloud platforms, Azure OpenAI, AWS Bedrock, Google Vertex AI, government-secure cloud environments
Canada (Treasury Board Secretariat)	Central AI governance, enterprise guidance and shared AI experimentation platform for federal departments with reusable AI services.	Microsoft Azure, secure Government of Canada cloud, open-source ML frameworks
Denmark	Shared AI infrastructure enabling municipalities and ministries to reuse AI solutions, particularly in healthcare and administration.	National Digital Infrastructure, common data services, cloud AI services

Alignment with
Chhattisgarh AI Mission -
Initiatives of global AI
Players

Sarvam – Work with Indian Government

Collaboration Activities	1 IndiaAI Mission Partnership	2 UIDAI (Aadhaar) Partnership – 2025	3 Open-source & research partnerships	4 Public-sector AI infrastructure
	Sarvam AI was selected by the IndiaAI Mission to develop indigenous foundational AI models designed for Indian languages and use cases.	Sarvam AI enabled secure, multilingual voice support, real-time fraud detection, and citizen feedback for Aadhaar services through an AI stack deployed entirely within UIDAI's air-gapped infrastructure.	Sarvam collaborates with institutions such as IIT Madras, including AI4Bharat and CeRAI, for developing foundational AI models under the IndiaAI ecosystem.	Sarvam has also partnered with state governments, including Odisha and Tamil Nadu, to build sovereign AI infrastructure and AI-driven public-service capabilities..

Use Case	Sector / Department	Outcome / Scale
Mining Safety & Industrial Monitoring	Odisha Government	Vision AI for Mine safety monitoring, industrial compliance monitoring, workplace risk detection
Odia-to-English Voice Skilling	Odisha Government	Sarvam announced Odia-English voice toolYouth skilling and job-readiness programs
AI enabled Document Digitization	GoI	Government forms digitization Record extraction Regional-language document processing (sarvam’s vision Api across 22 different languages)
Agriculture Advisory (Farmer-Facing)	GoI	Crop guidance, Farmer advisory services, Mandi price lookup, Weather alerts.Government scheme information (e.g., PM-Kisan) Pilot (1-25 Oct 2025)

STRATEGIC PILLARS

Sovereign AI Compute Infrastructure

Under partnerships with states such as Odisha, Sarvam is planning AI-optimized compute infrastructure intended to serve both state and national AI requirements.

Indian Foundation Models

The company was selected under the IndiaAI Mission to develop indigenous foundation models for India.

Population-Scale AI Applications

The focus is on making AI accessible through voice, local languages, and conversational interfaces.

Gnani.ai – Work with Indian Government

Collaboration Activities	1 IndiaAI Mission Partnership Gnani.ai was selected by the Government of India to develop a 14 billion parameter Voice Large Language Model (Voice LLM) that understands Indian languages, contexts, and accents.	2 Madhya Pradesh E-Governance MoU with MPOnline (a joint venture by the MP Government and TCS) to integrate AI-driven conversational solutions for citizen services, aims to make digital document management and service delivery more accessible	3 Skill India Partnered with the National Institute of Electronics and Information Technology (NIELIT) to enhance the Digital University platform with advanced speech and language technologies to support multilingual capabilities	4 Healthcare Provides omnichannel Voice AI assistants for healthcare and pharmaceutical customer engagement in partnership with Televox
--------------------------	--	---	--	--

Use Case / Initiative	Sector / Department / Partner	Outcome
14B Voice AI Foundation Model	IndiaAI Mission (MeitY)	Developing a 14-billion parameter multilingual Voice AI foundation model for real-time speech processing and advanced reasoning in Indian languages.
Voice AI for Public Sector Banking	Central Bank of India	Uses multilingual voice AI to improve repayment engagement and increase customer "Promise-to-Pay" rates through automated outreach.
Enterprise Voice AI Platform	200+ Enterprises across Banking, Government & Healthcare	Deploys Voice Agents, Speech Analytics, Voice Biometrics, and Agent Assist solutions, processing over 30 million voice interactions daily.

STRATEGIC PILLARS

Voice AI Foundation Models

Develops proprietary speech-to-text, text-to-speech, speech-to-speech, and language models optimized for real-world enterprise conversations

Agentic AI & Enterprise Automation

Builds AI agents capable of understanding intent, executing workflows, automating customer interactions, and integrating with enterprise systems.

Multilingual & Indic AI

Supports 40+ languages with strong performance in Indian languages, enabling voice-first AI for diverse users and multilingual service delivery

Shodh AI – Work with Indian Government

Collaboration Activities	1 IndiaAI Mission & MeitY Shodh AI is a deep-tech company selected under the Government of India’s IndiaAI Mission. Headquartered in Jaipur with operations in London, it builds specialized artificial intelligence solutions for scientific discovery and advanced research	2 Project Skanda Shodh AI, in collaboration with NVIDIA, launched Project Skanda—India’s first sovereign generative AI model for material science. It helps manufacturers predict a battery’s lifespan, charging speed, and safety by analyzing microscopic structural images.	3 State Government Programs Partnered with AESTR on a Sovereign AI Initiative in Jaipur, building an ecosystem to incubate young scientists and engineers for deep-tech research for its initiative build infrastructure in Jagatpura, a fast-rising tech district of Jaipur	4 LSMs and Physical AI Shifting focus from Large Language Models to Large Science Models powered by its collaboration with NVIDIA, also entering physical AI by developing AI models that understand the physical structure and behaviour of materials
	Use Case Project Skanda – Sovereign Material Science Foundation Model	Sector / Department IndiaAI Mission, Ministry of Electronics & Information Technology (MeitY), NVIDIA	Outcome Developed India's first sovereign generative AI model for materials science to accelerate scientific discovery and industrial R&D.	
	Use Case Battery Materials Intelligence	Sector / Department IndiaAI Mission, NVIDIA	Outcome Uses AI to analyze microscopic material images to predict battery lifespan, charging performance, and safety, reducing experimentation time.	
	Use Case Sovereign AI Infrastructure Initiative	Sector / Department AESTR Sovereign AI Initiative (Jaipur)	Outcome Establishes indigenous AI infrastructure and computing capabilities to support sovereign AI research and advanced scientific model development.	

STRATEGIC PILLARS

Sovereign AI for Science

Develops a 7B parameter model for material discovery and experimental workflows, an agentic AI platform for government use.

Foundation Models for Material Science and Manufacturing

Building the next material science foundational models offered as vertical SaaS on proprietary material manufacturing data. Building next catalysts, battery anodes, additive manufacturing feedstock, CO2 capture sorbets, etc.

Public-Private-Government Model

Has built partnerships with private players like NVIDIA and AESTR, and public and govt institutions like DRDO and Ministry of Defence

IBM – Work with Indian Government

Collaboration Activities	1 India AI Mission Partnership	2 Quantum Computing	3 Sovereign AI & Digital Governance)	4 National AI & Quantum Skilling
	IBM is actively partnering with the Indian Government and the IndiaAI Mission by focusing on sovereign AI development, digital governance, and national skilling initiatives	Partners with the Government of Andhra Pradesh, National Quantum Mission, and C-DAC to establish India's first quantum computing ecosystem, advance quantum research, and strengthen indigenous capabilities in quantum technologies.	Collaborates with BharatGen, the Government of Andhra Pradesh, and sovereign cloud providers to develop secure, culturally inclusive AI models and digital governance solutions using IBM watsonx and Granite foundation models.	Partners with the Ministry of Education, MeitY, universities, and government training institutions through IBM SkillsBuild to train 5 million learners by 2030 in AI, cybersecurity, quantum computing, and emerging technologies.

Use Case / Initiative	Sector / Department / Partner	Outcome
AI GovTech Innovation Center	Government of Uttar Pradesh	Develops and scales trusted AI solutions to modernize public administration, citizen services, and digital governance.
India's First Quantum Computing Hub	Government of Andhra Pradesh, National Quantum Mission, C-DAC	Establishes India's first IBM Quantum System to accelerate research, innovation, and workforce development in quantum computing.
Sovereign AI for Governance	Government of Andhra Pradesh, BharatGen	Builds secure, multilingual AI solutions using IBM watsonx and Granite models to support governance, healthcare, and financial services.

STRATEGIC PILLARS

Sovereign AI & Responsible AI

Develops secure, explainable, and governance-ready AI solutions using watsonx, Granite foundation models, and robust AI governance frameworks.

Quantum Computing & Emerging Technologies

Advances India's capabilities in quantum computing, semiconductors, and next-generation digital infrastructure through strategic government partnerships.

Government Digital Transformation & AI Skilling

Supports digital governance and workforce development through AI-powered public services, GovTech innovation, and nationwide AI and quantum skilling initiatives.

Salesforce – Work with Indian Government

Use Case / Initiative	Sector / Department / Partner	Outcome
YuvaAI Bharat: GenAI Skill Catalyst	IndiaAI Mission (MeitY), SmartBridge	Trains youth in Tier-II and Tier-III cities in Generative AI, Agentic AI, data annotation, and AI-ready workforce skills.
AICTE Virtual Internship Programme	AICTE	Provides students with hands-on AI projects, industry mentorship, and practical experience through virtual internships.

STRATEGIC PILLARS

AI Workforce Development

Builds India's AI talent pipeline through large-scale skilling, internships, and university partnerships under the IndiaAI Mission.

Agentic AI & Enterprise Automation

Enables organizations to deploy autonomous AI agents that automate complex business workflows and improve operational efficiency.

Trusted Enterprise AI

Combines unified enterprise data, generative AI, and built-in governance through Einstein AI, Data Cloud, and the Einstein Trust Layer to deliver secure, responsible AI.

Microsoft – Work with Indian Government

Collaboration Activities	1 IndiaAI Mission MoU	2 AI Productivity Labs	3 ADVANTA(I)GE India	4 AI startup acceleration programme (iMPEL-AI)
	Skilling 500,000 people (students, educators, govt officials, women entrepreneurs) by 2026; 'AI Catalysts' CoE for rural Tier-2/3 innovation; Founders Hub credits for up to 1,000 startups.	20 labs across NSTIs/NIELIT centres in 10 states - training 20,000 educators and 100,000 ITI students in foundational AI.	2.4M people trained in under a year against a 2M target. Goal now 10M by 2030 with State governments.	Support Indian AI startups through Azure AI, mentoring, technical assistance and ecosystem development

Use Case	Sector / Department	Outcome / Scale
eShram + National Career Service AI integration	Ministry of Labour & Employment	AI-enabled matching & delivery for 94 crore+ social-security beneficiaries
Shiksha Copilot	Government Schools (Karnataka)	AI assistant for teachers to generate lesson plans, assessments, classroom activities, and learning resources
Election Commission	Govt. of Uttar Pradesh and Tamil Nadu	AI enabled monitoring of critical polling stations with centralized video analytics
UP-100 / Emergency Response Support System	Govt. of Uttar Pradesh	AI-assisted emergency response, incident management, and dispatch platform
Digital Governance Platform	Maharashtra and UP RERA	Digital governance platform hosted on Microsoft Azure
AI enabled Govt. productivity tool	Maharashtra Industrial Development Corporation (MIDC)	AI-enabled productivity and digital workplace for government employees

Strategic Pillars

Hyperscale Infrastructure

3 datacentre regions live, 4th (Hyderabad South Central) landing mid-2026 - largest in India.

Sovereign-Ready Solutions

Cloud for Sovereignty; in-country data processing for Government, BFSI & Healthcare.

Nationwide Skilling

10M Indians to be AI-skilled by 2030, delivered with government, nonprofit & corporate partners.

Google – Work with Indian Government

Collaboration Activities	1 Karmayogi Bharat Partnership Google Cloud powers the iGOT Karmayogi platform for 20M+ public servants across 800+ districts, with content in 18+ Indian languages.	2 Google DeepMind National Partnerships Frontier 'AI for Science' models and GenAI innovation-hub assistants for Indian government bodies and research institutions.	3 Data Centre Investment \$15B AI Hub investment announced for Visakhapatnam, Andhra Pradesh	4 Education & Impact Challenges ₹85 crore grant for SWAYAM/POSHAN Tracker AI tools (75M students target). \$30M Google.org AI for Government Innovation Impact Challenge.
--------------------------	---	---	---	--

Use Case	Sector / Department	Outcome / Scale
HealthVaani conversational assistant	Health & Family Welfare / WCD	Gemini-powered support for ASHA & Anganwadi workers
AgriVaani (Garuda language model)	Agriculture	Multilingual crop & livestock advisory for farmers and agri-workers
AI Assistant for Govt orders and documents	Govt. of Andhra Pradesh	Working with RTGS dept. to provide GenAI Chatbot over Govt. orders, policies etc.
AI enabled farmer advisory	Govt. of Uttar Pradesh	Gemini-powered conversational assistant integrated with agricultural datasets. micro-climate information and provide farmers with localized climate information, market prices, and agricultural assistance

STRATEGIC PILLARS

Public Digital Infrastructure

Google Cloud powers iGOT Karmayogi for 20M+ civil servants across 18+ languages.

Frontier Research for Society

Google DeepMind's National Partnerships bring 'AI for Science' models to Indian institutions.

Inclusive, Local-Language Impact

HealthVaani & AgriVaani deliver Gemini-powered support in Indic languages for frontline workers & farmers.

OpenAI – Work with Indian Government

Collaboration Activities	1 Tata Group/Stargate Partnership	2 OpenAI Academy + MeitY	3 Learning Accelerator	4 Higher-Education Certifications
	AI-ready data-centre capacity via TCS's HyperVault (100MW scaling to 1GW) for data residency and government-grade workloads; ChatGPT Enterprise for Tata/TCS staff.	Nationwide AI-literacy program run in partnership with the Ministry of Electronics & Information Technology.	Approx. 500,000 ChatGPT licenses for teachers/students via the Ministry of Education (Classes 1-12), AICTE technical institutes, and ARISE schools; \$500K research grant to IIT Madras.	100,000+ ChatGPT Edu licenses with IIM Ahmedabad, AIIMS Delhi, Manipal, UPES & Pearl Academy; OpenAI Certifications rolling out with TCS.

Use Case	Sector / Department	Outcome / Scale
Local Language AI Assistants	Govt. of Odisha	Government AI training, public administration pilots, Odia-language AI applications
OpenAI Academy	Ministry of Electronics & IT (MeitY)	Nationwide AI-literacy program
ChatGPT Edu partnerships	Higher education	100,000+ licenses across IIM-A, AIIMS Delhi, Manipal, UPES, Pearl Academy

STRATEGIC PILLARS

Sovereign AI Infrastructure

Stargate-aligned HyperVault data centres with Tata/TCS for data residency & low latency.

Deep Enterprise Adoption

ChatGPT Enterprise & Codex rolling out across hundreds of thousands of TCS employees.

Nationwide Upskilling

OpenAI Academy with MeitY, plus Learning Accelerator & ChatGPT Edu for schools and universities.

Anthropic – Work with Indian Government

Collaboration Activities	1 Government MCP Server	2 Education (Pratham and CSF)	3 Agriculture & Local-Language Eval	4 Indic Language Investment & Security
	Ministry of Statistics & Programme Implementation (MoSPI), with Bharat Digital, launched India's first official government MCP server for querying national statistics via AI.	Claude-powered 'Anytime Testing Machine' piloted with 1,500 students / 20 schools (scaling to 100); reached 5,000+ women in Pratham's Second Chance program.	With EkStep Foundation on population-scale deployment. With Karya, Digital Green & Adalat AI building evaluations for agriculture and legal-domain Indic tasks.	Enhanced Hindi + 9 Indian languages; Claude Mythos (Project Glasswing) extended to India for cybersecurity vulnerability detection.

Use Case	Sector / Department	Outcome / Scale
AI-powered agricultural knowledge access	Gol	Claude models are being explored through the OpenAgriNet initiative to expand access to agricultural expertise and knowledge systems
Second Chance program	Women's education (Pratham)	Reached 5,000+ women who left formal schooling
Local-language evaluation suites	Agriculture & legal (Karya, Digital Green, Adalat AI)	Public evaluation sets for Indic-language, domain-specific tasks
Enterprise & cybersecurity deployments	Aviation, fintech, IT services	Air India, CRED, Cognizant (350K employees), Claude Mythos / Project Glasswing

STRATEGIC PILLARS

Public-Sector Trust & Data

First official Indian government MCP server (MoSPI) for querying national statistics via AI.

Education for the Underserved

Pratham's Anytime Testing Machine and Second Chance program reach students and women learners.

Security & Local-Language Depth

Claude Mythos for cybersecurity; Indic-language evaluations built with Karya & Digital Green.

AWS – Work with Indian Government

Collaboration Activities	1 IndiaAI Mission - SHI India	2 Maharashtra State MoU	3 Responsible AI	4 Compute Access for Government Workloads
	SHI India (empanelled AWS Partner) provisioned Amazon SageMaker & Bedrock so government departments, startups, academia and R&D bodies can train/customize LLMs without deep AI infra expertise.	\$8.3B cloud-infrastructure investment (signed at Davos, Jan 2025) to advance the State's digital ambitions and democratize access for public-sector and SME users.	AWS-hosted roundtables at the India AI Impact Summit 2026 on responsible AI, digital infrastructure and inclusive innovation policy.	Custom AI chips and managed AI services positioned explicitly for government organizations alongside startups and enterprises.

Use Case	Sector / Department	Outcome
AI enabled Grievance assistant	DARPG	Prepared a GenAI based workflow for grievance handling
Genomic Data Analysis	Department of Science & Technology (DST), Centre for Cellular and Molecular Biology (CCMB)	CCMB uses AWS services for genomic data storage and analysis workloads. Centre for Cellular and Molecular Biology Achieves 98% Time Savings for Data Analysis on AWS
Gen AI Assistants	Gol	Gen AI Assistants are deployed using AWS stack components

STRATEGIC PILLARS

Scaled Cloud & Compute

Expanding AWS datacentre capacity in Mumbai & Hyderabad for AI workloads.

State-Level Partnership

Maharashtra MoU model — democratizing cloud access for public-sector & SME users.

Responsible AI Leadership

AWS-hosted roundtables on responsible AI positioning India as a Global-South model.

Meta – Work with Indian Government

Collaboration Activities	1 Mana Mitra - Andhra Pradesh	2 Maharashtra & Odisha	3 Skill India Assistant (SIA)	4 Reliance-Meta Joint Venture
	WhatsApp chatbot consolidating public services (utility bills, temple bookings, transport, grievances) - grew from 161 to 200+ services within months.	Maharashtra targeting 500+ services on one number; Odisha integrating 429 government services via WhatsApp + Llama.	Built entirely on Llama for the Ministry of Skill Development & Entrepreneurship, agreed at WEF Davos 2025.	Llama-based enterprise AI solutions (sales, marketing, IT, customer service, finance) - a reusable blueprint for state-level enterprise AI stacks.

Use Case	Sector / Department	Outcome / Scale
Namma Arasu WhatsApp Government Services Chatbot	Govt. of Tamil Nadu	AI-enabled WhatsApp chatbot for citizen services such as certificates, payments, welfare schemes, registration services, and grievances. The solution uses Meta WhatsApp ecosystem capabilities.
Skill India Assistant (SIA)	Skill Development & Entrepreneurship	Llama-based chatbot guiding citizens on skilling opportunities
Llama backend for document retrieval	State government back-office (AP, Maharashtra)	Productivity tool for government employees' daily workflows
Reliance-Meta enterprise joint venture	Enterprise (sales, marketing, IT, finance)	Llama-based AI solutions built for Indian businesses at scale

STRATEGIC PILLARS

WhatsApp-Native Citizen Services

Single-number access to dozens of government services - bills, bookings, grievances.

Open-Source Enterprise AI

Reliance-Meta JV builds Llama-based enterprise solutions for Indian businesses at low cost.

Government Backend Productivity

Llama-powered document retrieval and productivity tools for government employees.

NVIDIA – Work with Indian Government

Collaboration Activities	1 IndiaAI Mission Partnership	2 Anusandhan National Research	3 Startup Ecosystem (Inception)	4 Early-Stage & Deep-Tech Programs
	Infrastructure and frontier model development support alongside Indian cloud/data-centre leaders, enabling sovereign foundation-model training.	Access to NVIDIA AI software plus mentorship, workshops and bootcamps for schools and universities; plans for an AI university in India.	\$4,000+ Indian AI startups supported; partnerships with Peak XV, Accel, Z47, Elevation Capital & Nexus to identify and fund new ventures.	India Deep Tech Alliance, AI Grants India (10,000+ founders) and Activate - reaching founders even pre-incorporation.

Use Case	Sector / Department	Outcome / Scale
AI based Agriculture advisory	Gol	Crop intelligence, AI-based advisory systems using NVIDIA stack
AI enabled monitoring	Smart Cities	Computer vision, traffic analytics, public safety analytics
AI enabled diagnostics	Gol - Healthcare	Medical imaging AI, diagnostics, clinical decision-support research
Gen AI enabled language initiatives	Gol	Indian language AI, multilingual assistants, speech and translation models using NVIDIA NeMo, NIM, GPU infrastructure

STRATEGIC PILLARS

Sovereign Compute Infrastructure

Tens of thousands of Blackwell/H100 GPUs hosted via Yotta, E2E Networks, Netweb.

National Research Partnership

Anusandhan National Research Foundation collaboration for schools & universities; AI university planned.

Startup & Founder Ecosystem

Inception, India Deep Tech Alliance, AI Grants India & Activate reach founders pre-incorporation.

BharatGen – Work with Indian Government

Collaboration Activities	1 IndiaAI Mission & MeitY Supported under the IndiaAI Mission and MeitY, BharatGen is building India's sovereign multilingual AI ecosystem to enable trusted AI adoption across government departments and digital public infrastructure.	2 BHASHINI Collaboration Partners with BHASHINI to develop multilingual AI models across 22+ Indian languages, enabling real-time translation, speech technologies, and accessible citizen-centric digital services.	3 AI-powered telemedicine services aAn AI doctor communicates with patients in their native language and connects remote regions with specialist healthcare networks. The government cited this as a working deployment example during the BharatGen launch.	4 Bharat Data Sagar Initiative Collaborates with government agencies and academic institutions to build India-centric datasets encompassing regional languages, dialects, and cultural diversity, enabling inclusive and representative
	Use Case	Sector / Department	Outcome	
	Multilingual Citizen Assistant	MeitY, BHASHINI, Government Service Portals	AI assistants enabling citizen services in 22+ Indian languages.	
	Krishi Sathi (Agriculture Advisor)	Agriculture Departments & Rural Development Agencies	Provides farmers with localized crop advisory, voice-based interactions, and data-driven recommendations in regional languages.	
	Document Intelligence & e-Governance AI	Central & State Government Departments	Automates document understanding, translation, summarization, and information retrieval for faster government workflows and service delivery.	

STRATEGIC PILLARS

Bharat Data Sagar

India-centric datasets covering language, culture, heritage, and governance data.

Multilingual Foundation Models

AI models supporting 22+ Indian languages. Text generation, translation, and reasoning in Indian contexts.

Public-Private-Academia-Government Model

BharatGen follows a Public-Private-Academia Partnership (PPAP/PPP) model, bringing together: Government ministries IITs, IIITs, and IIMs ,Industry, partners,Startups

Hanooman AI – Work with Indian Government

Use Case / Initiative	Sector / Department / Partner	Outcome
Hanooman Multilingual Generative AI Platform	Government Digital Services (Proposed Public Sector Adoption)	Enables multilingual AI interactions, document translation, and citizen assistance across 12 Indian and 98 global languages.

STRATEGIC PILLARS

Multilingual Generative AI

indigenous generative AI platform supporting 98 global languages and 12 Indian languages, designed to make AI accessible across India's diverse linguistic landscape.

Enterprise AI Platform

Provides a full-stack enterprise AI platform built on its proprietary DISM Architecture, integrating NLP, machine learning, computer vision, and intelligent automation.

Sovereign AI

Emphasizes data sovereignty, ensuring AI models and data remain within India.

Yellow.ai – Work with Indian Government

Collaboration Activities	1 IndiaAI Mission Partnership	2 Digital Citizen Services & Public Sector Automation	3 Enterprise Conversational AI & Agentic AI	4 Multilingual Voice AI & Enterprise Transformation
	Participates in the IndiaAI Mission ecosystem, supporting India's vision of building indigenous and responsible AI capabilities through enterprise-grade conversational and agentic AI solutions.	Collaborates with government departments like BMRCL, DWCD, and MP Electricity Board to deploy multilingual AI assistants for citizen engagement, service discovery, complaint resolution, and public awareness campaigns. Scale: Supported government-sector deployments serving 2.7M+ citizens and enabling 79M+ AI-powered citizen-service interactions across public-sector organizations.	Develops AI-powered chat and voice agents that automate customer support, grievance redressal, and service delivery for enterprises and government organizations for partners like IndiaAI Mission, BPCL, Enterprise Customers	Builds next-generation multilingual voice AI platforms, including Nexus Vox, enabling real-time AI conversations across 500+ languages while helping organizations automate workflows and improve customer experiences in partnership with global enterprises
	Use Case / Initiative	Sector / Department / Partner	Outcome	
	Namma Metro AI Assistant	Bangalore Metro Rail Corporation Limited (BMRCL)	Deployed a multilingual AI chatbot on WhatsApp to help commuters recharge metro smart cards, locate stations, check fares, and access metro services.	
	Poshan & Maternal Welfare Campaign	Government of Maharashtra – Department of Women and Child Development (DWCD)	Delivered over 4.2 million AI-powered informational campaigns on nutrition, maternal health, and welfare schemes for pregnant and lactating mothers across urban and rural Maharashtra.	
	Citizen Support Chatbot	Madhya Pradesh Electricity Board	Automated customer support for electricity consumers, including bill-related queries, complaint registration, and service requests.	
	Customer Service Automation	Bharat Petroleum Corporation Limited (BPCL)	Enabled AI-powered customer engagement, automated query resolution, and digital service delivery across customer touchpoints.	

STRATEGIC PILLARS

Conversational AI & Autonomous AI Agents

Develops enterprise-grade AI agents that automate customer and citizen interactions across chat and voice channels using generative AI.

Omnichannel Customer & Citizen Experience

Delivers seamless AI-powered engagement across WhatsApp, web, mobile apps, IVR, email, and social media for consistent digital service delivery.

Multilingual Voice AI & Enterprise Automation

Enables real-time multilingual voice and chat automation with advanced speech AI, helping organizations streamline workflows and improve service efficiency.

Thanks
